Geotechnical Completion Report

HITCHEN BLOCK STAGES 6E AND 10A TO 10D

For

DFH JOINT VENTURE LIMITED

J00113 | Lander Geotechnical Consultants Limited | 16 December 2020

16 December 2020 Ref No: J00113

DFH Joint Venture Limited
PO Box 302 877
North Harbour 1330

Attention: Mr R Parkinson

Dear Russell

RE: Geotechnical Completion Report for Hitchen Block Stages 6E & 10A to 10D, Pokeno

This report presents all supporting geotechnical data and our Suitability Statement in relation to land development works undertaken at the above location.

It has been prepared in accordance with instructions received from DFH Joint Venture Limited and forms part of the documentation required by Waikato District Council to achieve certification under Section 224(c) of the Resource Management Act.

If you have any queries or you require any further clarification on any aspects of this report, please do not hesitate to contact the undersigned.

For and on behalf of Lander Geotechnical Consultants Limited

Shane Lander

Principal Geotechnical Engineer
CMEngNZ, CPEng., IntPE(NZ)

Lander Geotechnical Consultants Limited

1 INTRODUCTION AND DESCRIPTION OF SUBDIVISION

This Geotechnical Completion Report has been prepared for DFH Joint Venture Limited as part of the documentation required to be submitted to the Waikato District Council following residential subdivisional development.

It contains our Suitability Statement, relevant test data and the CivilPlan Consultants Limited as-built plan set relating to Stages 6E and 10A to 10D of the Hitchen Block Residential Subdivision as follows:

Table 1: CivilPlan Consultants Limited As-Built Plans

Title	Reference No.	Date
As Built Contours	136701-10-AB200	November 2020
As Built Cut-Fill Contours	136701-10-AB201	November 2020
Retaining Wall As Built	136701-10-AB202	November 2020
Roading As Built	136701-10-AB300	November 2020
Stormwater As Built	136701-10-AB400	November 2020
Wastewater As Built	136701-10-AB401	November 2020

This report covers the construction period October 2016 to December 2020. It is intended to be used for certification purposes as follows:

- 66 residential lots numbered 6, 15 to 18 and 486 to 546;
- 4 new roads named Harriet Johnston Drive (part), Frankfield Road (part), Lathem Crescent (part) and Hale Court;
- 3 jointly owned access lots that provide vehicle access to lots 496-497, 501-502 and 523-525;
- 1 stormwater reserve located in the south-western portion of Stage 10A, containing a permanent stormwater pond

This stage of the subdivision is located as shown on the attached CivilPlan Consultants Limited as-built plan. As can be seen on the As Built Cut-Fill Contours plan, approximately half of the residential lots have been partly or totally affected by filling, to a maximum depth of approximately 4m.

2 RELATED REPORTS

A Geotechnical Investigation Report on the subject land was prepared by this Consultancy, reference J00323 (Earthworks Stage 3), dated 30 June 2016. The conclusions and recommendations of that report have been reviewed during the preparation of this document, along with the following Geotechnical Completion Reports (prepared by Lander Geotechnical Consultants Limited) on adjacent recently completed stages of the subdivision which are tabulated below:

Table 2: Lander Geotechnical Consultants Geotechnical Completion Reports

Subdivision Title	Reference No.	Issue Date
Hitchen Block Stage 1 (Residential)	J00113	23 December 2016
Gateway Industrial Part Stage 5 (Lots 28 and 29)	J00022	27 February 2017
Hitchen Block Stage 2A and 2B (Residential)	J00113	14 July 2017
Hitchen Block Stage 2C and 3A (Residential)	J00113	27 October 2017
Hitchen Block Stage 3A2, 3B and 3C (Residential)	J00113	20 December 2017
Hitchen Block Stage 5A (Residential)	J00113	26 January 2018
Hitchen Block Stage 4A (Residential)	J00113	23 March 2018
Hitchen Block Stage 6A and 6B (Residential)	J00113	23 May 2018
Hitchen Block Stage 4B (Residential)	J00113	28 August 2018
Hitchen Block Stage 7A & 7B (Residential)	J00113	2 November 2018
Hitchen Block Stage 8A & 8B (Residential)	J00113	9 May 2019
Hitchen Block Stage 6D (Residential)	J00113	4 November 2019
Hitchen Block Stages 11, 12 and 14 (Residential)	J00113	13 March 2020
Hitchen Block Stage 9 (Residential)	J00113	24 June 2020

3 EARTHWORKS OPERATIONS

3.1 Plant

The main items of plant used by the Contractor, Kerry Dines Limited were:

- 7 x bulldozers with scoops,
- 1 x elevating motorscraper,
- 3 x articulated dump trucks,
- 2 x 4WD sheepsfoot compactors,
- 4 x 20T hydraulic excavators,
- 1 x Tractor with disc ploughs.

3.2 Construction Programme

Earthworks operations for this stage commenced in November 2016 with the topsoil stripping and bulk cuts over the lots and within the permanent stormwater pond which are formed in cut ground. These works continued until January 2018 concurrently with earthworks occurring in adjacent stages of the subdivision.

In December 2017, gully muckout operations commenced through the main gully in this stage (located beneath Harriet Johnston Drive and Hale Court). These muckout operations continued until March 2018. Following this, underfill drainage (comprising of 160mm perforated drain coils, covered with

drainage aggregate and fully wrapped with geotextile cloth) was installed along the gully invert and fill placement commenced. In locations where deep firm alluvial materials or groundwater seepages were encountered, additional underfill drainage and/or a mattress of SPR hardfill was placed to facilitate fill placement.

Bulk filling operations and subsequent topsoiling of the lots continued until September 2018. Following this civil construction (services and roading) progressed and was completed by late 2020.

4 QUALITY ASSURANCE AND CONTROLS

4.1 Inspections

During earthworks construction, engineering observations were undertaken on a near regular basis to assess compliance with NZS 4431 and our project specific recommendations and specifications. Project specific inspections were required on this stage of the development for:

- Topsoil stripping of earthworks areas;
- Removal of soft sediments in the gully inverts;
- Placement of the underfill drains;
- Fill placement and plant performance upon the subgrade periodically throughout the bulk filling works.

4.2 Quality Control

4.2.1 Compaction Criteria

Due to the varying soil types being used as filling, the compaction control criteria of minimum allowable shear strength and maximum allowable air voids were mainly used for quality assurance purposes.

Specification details were as follows for general fills:

Minimum Shear Strength and Maximum Air Voids Method

(a)	Air Voids Percentage	
	(As defined in NZS 4402)	
	Average value less than	10%
	Maximum single value	12%
(b)	Undrained Shear Strength	
	(Measured by Pilcon shear vane - calibrated using NZGS 2001 method)	
	Average value not less than	140 kPa
	Minimum single value	120 kPa
Note:	The average value shall be determined over any ten consecutive tests	

4.2.2 Compaction Assurance Testing

Regular insitu density, strength and water content tests were carried out on all areas of the filling at or in excess of the frequency recommended by NZS 4431, and a series of hand auger boreholes were also

drilled at selected locations as an added check on quality control. The results of this testing (including testing some testing undertaken on adjacent stages of the subdivision) are appended in Appendix 2.

5 PROJECT EVALUATION

5.1 Bearing Capacity and Settlement of Building Foundations

Following the completion of earthworks operations, we returned to the site in November 2020 and drilled a series of hand auger boreholes in order to determine representative finished ground conditions and hence evaluate likely foundation options for future building development.

At current subgrade levels all filled and undisturbed natural ground has a geotechnical ultimate bearing capacity of 300 kPa within the influence of conventional shallow residential building foundation loads.

Where any building platforms have been rutted by heavy machinery subsequent to this report, or softened due to ponded rainwater, engineering advice should be sought with a view affected areas be trimmed back to competent ground and reinstated with compacted hardfill to design subgrade level prior to the commencement of building construction.

It should be noted that NZS 3604 only allows a maximum backfill depth of 600mm over the building platform of a dwelling unless an Engineering design solution or endorsement is proposed, on account of the risk of induced consolidation of the subsoils caused by the weight of the backfill.

5.2 Expansive Soils

Two sets of Atterberg Limit expansive soil tests and four Shrink-Swell Index tests were carried out on samples selected from around the site and within the zone of likely influence of shallow building foundations to inform the expansive Site Class for this stage of the subdivision. Our assessment has taken into account both the Atterberg Limit and Shrink-Swell laboratory test results.

The Atterberg Limit tests were carried out in accordance with NZS 4402, "Methods of Testing Soils for Civil Engineering Purposes" test section 2 and were primarily intended to assess the Expansive Classes of the site materials as defined in AS 2870, "Residential Slabs and Footings – Construction".

The Shrink-Swell Index tests were carried out in accordance with AS 1289, "Methods of Testing Soils for Engineering Purposes" test method 7.1.1 and were primarily intended to assess the Expansive Classes of the site materials as defined in AS 2870, "Residential Slabs and Footings – Construction".

Based on the laboratory testing and visual tactile assessments of the soils observed in our post-construction boreholes, the Expansive Site Classes for this stage of the subdivision are M (moderate) for residential lots 6, 15, 18, 492 to 503, 508 to 536, 538 to 540, 545 and 546, and H (high) for residential lots 16, 17, 486 to 491, 504 to 507, 537 and 541 to 544, as defined in MBIE Acceptable Solutions and Verification Methods amendment 19[1].

[1] Ministry of Business, Innovation and Employment. Verification Methods and Acceptable Solutions Amendment 19 for NZ Building Code B1/AS1, Section 3 (as relevant to expansive soils and good ground). Effective 28 November 2019.

The characteristic surface ground movement (y_s) for Expansive Site Classes M and H is up to 44mm and 78mm, respectively. Details relating to these Expansive Site Classes are provided in Appendix 3, and specific design alternatives for these Site Classes are presented in the Suitability Statement. These classifications may be re-addressed by end users during building consent if site specific laboratory shrink-swell testing is undertaken, as recommended in the MBIE document attached.

For Class H soils, if slab on-grade floor slab construction takes place during a long dry summer, exposed building platform soils may dry put and become highly desiccated. Over time the rehydration of the soils below the floor slab can cause swelling and floor slab uplift. Floor slab uplift can cause distress of tile floors and in garages where cracks are more apparent. It may also rack upper storeys and/or rooflines if non-load bearing ground floor walls are lifted and act as struts. It is prudent to place hardfill immediately upon completion of subgrade trimming, followed by thorough soaking of the hardfill prior to concrete placement (e.g. for slab on-grade construction), all of which can help to limit the problem.

5.3 Lot Gradients

The appended as built contours plan shows areas having gradients steeper than 1(v) in 4(h) or being immediately adjacent to land having such gradients. The extent of these areas has been determined by the surveyed site gradients and our final walkover inspection, but there may be localised areas having such gradients that have not been shown on the plans.

We are satisfied that these lots are not subject to the hazards described in section 71(3) of the Building Act.

Details of resulting building and earthworks restrictions within the vicinity of these lots are presented in the Suitability Statement.

5.4 Fill Induced Settlement

As a result of our pre-fill inspections, the installation of subsoil drainage, quality control testing and the elapsed time since the placement of the majority of the filling (i.e. in excess of 12 months), we are of the opinion that induced differential settlements beneath or within the certified filling due to its imposed weight should be insignificant with respect to conventional NZS 3604 residential building development.

5.5 Stormwater Controls

It is important on all sloping lots that due care is paid to the design and construction of appropriate stormwater disposal systems. These systems should serve to collect all runoff from roofs, decks and paved areas, together with discharges from retaining wall drains and other subsoil drains and should connect directly into the public stormwater drainage network.

Uncontrolled stormwater discharges onto the ground surface can cause erosion, scour and/or instability on sloping land and should not be permitted under any circumstances where stability could be compromised.

5.6 Service Trenches

As is normal on all subdivisions, building developments involving foundations within a 45° zone of influence from pipe inverts will require Engineering input.

5.7 Underfill Drains

The appended fill as-built cut-fill contour plans show the alignments of perforated underfill drains that were placed in mucked out gully inverts prior to filling to tap groundwater seepages. These drains run beneath portions of residential Lots 490, 491, and 537.

These drains were intended to intercept localised groundwater seepages during earthworks and/or allow engineered fill placement as required by the project specifications. The drains were installed as a precautionary measure, not as remedial works for any existing instability, and they need no specific maintenance.

Notwithstanding, it is recommended that future foundations or site development works preserve these drains. In the event that they are compromised by any future development in any of the lots they should be reinstated under geotechnical engineering observational guidance.

5.8 Retaining Walls

At the south-eastern boundary of lot 6 and the northern boundary of lots 521 to 523, the site has been stabilised within adjacent lot 7 by the construction of a boundary timber pole retaining wall. This work was completed as part of the adjacent Stage 9 residential subdivision, with the wall construction being completed between July and August 2019. This wall reaches a maximum height of approximately 2.4m metres and was designed and inspected by this Consultancy. For completeness, a copy of our Producer Statement - Construction Review (PS4) is appended.

Details of resulting building and earthworks restrictions within the vicinity of this wall are presented in the Suitability Statement.

5.9 Stormwater Detention Pond

A stormwater detention pond has been constructed in within the south-west portion of Stage 10A. We were not involved in the design or construction supervision of this pond or its outlet structures/conduits. The clay fill placed within the pond area has been compacted to the compaction criteria outlined in Section 4.2.1.

5.10 Topsoil

Topsoil depths in likely building platform areas were checked by the drilling of a borehole in the approximate centre of lot. Our findings, which are indicative only and subject to variation at other locations, show that likely topsoil depths are between 50 mm and 300 mm, with lot 537 recording a topsoil reading of 400mm.

Site specific findings are presented in the Suitability Statement Summary.

5.11 Contractor's Work

We have relied on the Contractor's work practices and assume that the works have been carried out in accordance with:

(i) The approved Contract drawings and design details,

(ii) The approved Contract specifications,

(iii) Authorised Variations to (i) and (ii) during the execution of the works,

(iv)The conditions of Resource, Earthworks and Building Consents where applicable,

(v) The relevant Lander Geotechnical Consultants Limited reports, recommendations and site instructions,

and that all as-built information and other details provided to the Client and/or Lander Geotechnical Consultants Limited are accurate and correct in all respects.

6 STATEMENT OF PROFESSIONAL OPINION AS TO THE SUITABILITY OF LAND FOR BUILDING DEVELOPMENT

I, S.G. Lander, of Lander Geotechnical Consultants Limited, Auckland, hereby confirm that:

1. I am a Chartered Professional Engineer experienced in the field of geotechnical engineering as defined in section 1.2.3 of NZS 4404 and was retained by the Owner/Developer as the Geotechnical Engineer on Stages 6E and 10A to 10D of the Hitchen Block residential subdivision.
2. The extent of preliminary investigations carried out to date are described in Geotechnical Investigation Report reference J00323, dated 30 June 2016, and the conclusions and recommendations of that document have been re-evaluated in the preparation of this report. The results of all tests carried out under Lander Geotechnical Consultants Limited direction are appended.
3. In my professional opinion, not to be construed as a guarantee, I consider that:

   (a) The earth fills shown on the appended fill as-built plan have been placed in compliance with NZS 4431 and related documents.

   (b) The completed earthworks give due regard to land slope and foundation stability considerations within the residential lots, however, as shown on the appended contour as-built plan, lots 521 to 524 and 537 have gradients steeper than 1(v) in 4(h).

   Any building development and/or earthworks proposals within the areas shown to be steeper than 1(v) in 4(h) on the as-built contours plan are subject to specific geotechnical investigations and/or foundation design.

   (c) The function of the underfill drains should not be impaired by any building development or landscaping works. In particular, any bored or driven piles must be positioned to avoid damaging the underfill drains. The drains are shown pass under portions of residential Lots 490, 491 and 537 at depths typically greater than 1m below existing ground level and therefore should not adversely affect shallow foundation systems (dependant on final earthworks proposals). Further comments relating to these drains is provided in the suitability statement summary.

   (d) A geotechnical ultimate bearing capacity of 300 kPa may be assumed for foundation design on all lots (except where specific geotechnical endorsement is required on account of sloping land greater than 1(v in 4(h)).

   Where a geotechnical bearing capacity greater than 300 kPa is required, (i.e. outside the limits of NZS 3604, such as when piling is undertaken), further specific site investigation and design of foundations should be carried out prior to building consent application.

(e) The backfilling and compaction of the stormwater and sanitary sewer trenches on this subdivision has where possible been carried out to appropriate standards having regard for the prevailing ground conditions and associated compaction induced pipe loadings.

(f) The assessed Expansive Site Class in terms of MBIE Acceptable Solutions and Verifications Methods for NZ Building Code Clause B1 Structure, effective 28 November 2019, is M (moderate) for lots 6, 15, 18, 492 to 503, 508 to 536, 538 to 540, 545 and 546, and H (high) for lots 16, 17, 486 to 491, 504 to 507, 537 and 541 to 544. The characteristic surface ground movement for these Site Classes is up to 44mm (Class M) and 78mm (Class H), respectively in regards to the above standard. Site specific laboratory testing may be undertaken by end-users to re-assess the expansive site class during building consent stage.

(g) For lots 6 and 521 to 523, no building construction, including the construction of additional retaining walls and no additional earthworks should take place should take below the existing retaining wall situated at the northern boundary (Lots 521 to 523) and eastern boundary (lot 6) within a distance of 1.5x times the wall face height) without engineering endorsement/ assessment. Specific distances from the retaining wall are provided in the Suitability Statement Summary.

(h) Subject to the geotechnical limitations, restrictions, recommendations and expansive soil assessments associated with 3(b), 3(c), 3(d), 3(e), 3(f) and 3(g) above:

(i) The filled and undisturbed original ground within residential lot boundaries is generally suitable for residential buildings constructed in accordance with NZS 3604 and related documents.

(ii) On residential lots 6, 15, 18, 492 to 503, 508 to 536, 538 to 540, 545 and 546 foundation design may be carried out in accordance with Class M (in terms of MBIE Acceptable Solutions and Verifications Methods for NZ Building Code Clause B1 Structure, effective 28 November 2019) or alternatively, a specific foundation and structural design may be undertaken by a Chartered Professional Engineer who should allow for expansive soil effects referenced above in the design

For buildings having brittle exterior cladding appropriate control joints should also be specifically designed depending on architectural specifications and structural form.

(ii) On residential lots 16, 17, 486 to 491, 504 to 507, 537 and 541 to 544 foundation design may be carried out in accordance with Class H (in terms of MBIE Acceptable Solutions and Verifications Methods for NZ Building Code Clause B1 Structure, effective 28 November 2019) or alternatively, a specific foundation and structural design may be undertaken by a Chartered Professional Engineer who should allow for expansive soil effects referenced above in the design.

For buildings having brittle exterior cladding appropriate control joints should also be specifically designed depending on architectural specifications and structural form.

4. Road subgrades and lot accessway subgrades have been formed having due regard for slope stability and settlement, available subgrade strengths are dependent on-site conditions and on construction trafficking and variable results should be expected.

5. The permanent stormwater pond within stage 10A has been formed to standards appropriate for its intended use.

The professional opinion contained within this report is furnished to the Waikato District Council and DFH Joint Venture Limited for their purposes alone, with respect to the particular brief given to us. It may not be relied upon in any other context of for any other purpose without our prior review and agreement. It does not remove the necessity for the normal inspection of site conditions at the time of erection of any dwelling.

The appended table summarises the status of each residential lot covered by this Suitability Statement.

Laboratory Test Report

The samples we collected from the above mentioned site have been tested according to your instructions and the results are included in this report. Results apply only to the sample(s) tested.

Descriptions are enclosed for your information, but are not covered under the IANZ endorsement of this report.

This report has been prepared for the benefit of Lander Geotechnical Ltd., with respect to the particular brief given to us and it cannot be relied upon in other contexts or for any other purpose without our prior review and agreement.

This report may be reproduced only in full.

Samples not destroyed during testing will be retained for one month from the date of this report before being discarded. If we can be of any further assistance, feel free to get in touch. Contact details are provided at the bottom of this page.

Material Test Report

Report No: MAT:S20TG000408
Issue No: 1

Customer: Lander Geotechnical
Address: Level 3, 3 Osterley Way
Manukau, 2104
Project: Stages 6E & 10A-H Hitchen Subdivision
Project No.: 1009521.1105.0.0
Customer Reference No.: J00113
Report Authorised By : Ryan Milligan

Approved By:
Ryan Milligan
(Development Manager)
Date of Issue: 3/12/2020

Sample Details

Location	Stages 6E & 10A-H Hitchen Subdivision
Geotechnics ID	S20TG000408
Sample Reference	502
Sample Description	silty SAND with some clay; light brown. Moist, non-plastic.
Sample Depth	0.5m
Bottom Depth	1.0m

Test Results

Description	Method	Result	Limits
Moisture Content [NZS 4402:1986 Test 2.1]			
Moisture Content (%)		18.4	
Date Tested		2/12/2020	

Comments

This test result is IANZ accredited.

If samples have been taken, and were not destroyed during testing, they will be retained for one month from the date of this report before being discarded.

3.2 Slab-on-ground in expansive soils

3.2.1 NZS 3604 Clause 1.1.2 Buildings covered by this Standard

Amend 1.1.2(a) to read:

"Buildings founded on good ground or on expansive soils where the requirements of 1.1.5 are met"

3.2.2 NZS 3604 New Clause

Add new: "**Clause 1.1.5 Buildings on expansive soils**

Buildings on expansive soils shall be supported on slab-on-ground foundations complying with 7.5.13 and in addition to 1.1.2 shall be limited as follows:

(a) single storey, stand-alone household unit, and

(b) maximum length or width of floor of 24.0 m including any attached garage, and

(c) simple plan shapes such as rectangular, L, T or boomerang, and

(d) concrete slab-on-ground with a minimum thickness of 100 mm and a minimum concrete compressive strength of 20 MPa, and

(e) simple roof forms, incorporating hips, valleys, gables or mono pitches, and

(f) maximum overall height of 7.0 m to roof apex from lowest cleared ground level, and

(g) maximum roof height of 3.0 m, and

(h) roof slope between 10° and 35° from the horizontal, and

(i) maximum span of roof truss 12.0 m, and

(j) external walls maximum of 2.4 m height studs, other than gable end walls and walls to mono-pitched roofs, which shall not exceed 4.0 m.

COMMENT:

Floor plans

Where floor plans incorporate re-entrant corners then continuity of the exterior ground beam shall be maintained by continuing it as an internal beam, with the exterior beam details continued for a length of at least 1.0 m into the internal beam. This is only applicable where internal beams are specified in Tables 7.4A and 7.4B. This is aimed to bring the solution in NZS 3604 in line with Clause 5.3.8 of AS 2870:2011.

Amend 19
Nov 2019

Ground movement

Provision for the additional ground movement effects from trees near to foundations in expansive soils should be considered. Trees remove moisture from the soil for a radius equal to the height of the tree. This causes expansive soils to shrink to varying degrees, and when near houses leads to differential settlement occurring under foundations. Movement of the foundations may lead to cracks in the building and door jamming.

Where existing trees (including trees that have been recently removed) are located closer to the foundations than 1.5 times the mature height of a tree, then additional geotechnical advice should be obtained. Planting of new trees should be avoided near foundations of new buildings or neighbouring buildings on sites with expansive soils.

3.2.3 NZS 3604 Clause 7.5.1

Add the following paragraph at the end of Clause 7.5.1:

"Slabs on expansive soils for buildings meeting the requirements of 1.1.5 shall, in addition to meeting the requirements of 7.5.1 to 7.5.12, meet the requirements of 7.5.13. Where there is conflict the requirements of 7.5.13 shall apply."

3.2.4 NZS 3604 New clause, tables and figures

Add new: **Clause 7.5.13 Slab-on-ground in expansive soils**

7.5.13.1 Identification of expansive soils

7.5.13.1.1 Should reasonable enquiry as outlined in 3.1.3 show any signs of expansive soils, the expansive soil class, as defined in AS 2870, shall be established by one or all of:

(a) enquiry to the local territorial authority, and/or

(b) reference to the certificate of suitability issued in terms of NZS 4431, and/or

(c) a soil test undertaken by a suitably qualified soils engineer.

7.5.13.1.2 Expansive soil class shall be defined as:

(a) Slightly 'S', having an I_{SS} range of 0–1.9%, and a 500 year design characteristic surface movement return (y_S) of 22 mm, or

(b) Moderately 'M', having an I_{SS} range of 2.0–3.7% and a 500 year design characteristic surface movement return (y_S) of 44 mm, or

Amend 19
Nov 2019

(c) Highly 'H', having an I_{SS} range of 3.8–6.5%and a 500 year design characteristic surface movement return (y_S) of 78 mm, or

(d) Extremely 'E', having an I_{SS} range of 6.6–7.5% and a 500 year design characteristic surface movement return (y_S) of 90 mm.

7.5.13.2 Maximum aspect ratio of concrete slabs

The aspect ratio of the concrete slabs or bays of concrete slabs, such as in the case of L, T or boomerang concrete slab shapes, shall not exceed 5 to 1 (length to width).

7.5.13.3 Foundation details

7.5.13.3.1 For the identified expansive soil class the foundation details, external and internal thickenings shall be as follows.

(a) For light wall claddings refer to Table 7.4A and Figure 7.22.

(b) For medium wall or heavy wall claddings refer to Table 7.4B and Figure 7.23.

7.5.13.3.2 Situations where no internal thickenings shall be required are limited to a rectangular slab with long side not exceeding 17.0 m. Where this limit is exceeded, add additional internal thickenings across the slab with the same cross section dimensions and reinforcing as the external footing, so that the centre to centre spacing of thickenings is always less than 17.0 m.

COMMENT:

Design constraints:

a) The characteristic surface movements and the corresponding expansivity classifications have been calculated based on design for ultimate limit state (ULS) conditions for a 1 in 1000 year "extreme" drought event, and the serviceability limit state (SLS) conditions for a 1 in 500 year drought event.

b) Maximum soil movements are calculated to be based on a 500 year return period for SLS, and a 1000 year return period for ULS*;

(*NB: *This differed from the recommendations contained within BRANZ Study Report 120A (BSR120A) which used a 300 year return period for the design level drought conditions)*

Amend 19
Nov 2019

c) Climate parameters adopted from BSR120A of Δu = 1.2 pF, Hs = 1.5 m, and a crack depth of 0.5 Hs

d) The I_{SS} (soil stability index) ranges attributed to the expansivity classifications as defined in 3.2.4 above have been calculated using the parameters presented in BSR120A and Equation 2.3.1 of AS 2870:2011.

e) Sites subject to parameters that differ from those mentioned above, in particular sites where the crack depth is less than 0.75 m, such as cut natural ground or clay backfill, require specific engineering assessment to confirm their appropriate site classification.

f) The effects of nearby trees (whether existing, recently removed, or future planting) are not considered in these solutions. It is recommended that specific geotechnical engineering advice is obtained where a tree is within a lateral distance of 1.5 times its mature height of the foundations.

Maintenance of foundations in expansive soils

Normal maintenance is that work generally recognised as necessary to achieve the expected performance over time of the foundation located on expansive soils. Unless otherwise specified by the designer and noted on the drawings, basic normal maintenance tasks should ensure that:

a) the drainage and wetting of the site is controlled so that extremes of wetting and drying of the soils are prevented, and

b) the position and operation of gardens adjacent to the dwelling are controlled, and the planting of trees near to foundations is suitably restricted, and

c) any leaks which develop in plumbing, storm water or sanitary sewage systems are repaired promptly.

Amend 19

Producer Statement (PS4)

LANDER
geotechnical

18 February 2020 Ref No: J00113

DFH Joint Venture Limited

Attention: Mr K Dines

Dear Kerry,

RE: Construction Observations for Noble Retaining Wall at Hitchen Subdivision, Stage 9

This letter is to confirm that we visited the above site on six occasions between 26 July 2019 and 17 February 2020 to observe the ground conditions within the retaining wall pile holes, and also to confirm that all elements of our retaining wall design had been adhered to (i.e. pile diameters, spacings, depths, SED's, wall railings and drainage outlets).

We confirm that we sighted all retaining wall pile holes prior to concreting and these had been drilled to depths of up to 3.5m. Shear vane testing at the sides and bases of the holes were all in excess of 70kPa as per our design. Likewise, all the above mentioned elements of the walls were constructed as per the recommendations of our Geotechnical Design Report (Ref. J00113, dated 16 April 2018).

Our Producer Statement – Construction Review (PS4) is attached.

For and on behalf of Lander Geotechnical Consultants Limited

Construction Observation Records

18/10/16 - Stage 3 Begins

Tuesday, 18 October 2016 6:13 p.m.

Site Inspection Record

Date & Time:	18/10/16
Author:	CE+MVC
Plant Operating:	
Weather:	Fine

Site Observations and Instructions:
Meeting with Trevor (New foreman for Dines).
Drove over site and discussed earthworks for the new season within stages 2 and 3.
They have started stripping topsoil from a number of areas and started drying fill out with Fill area F.
Fill compaction to recommence later this week.

31/10/16

Monday, 31 October 2016 1:57 p.m.

Site Inspection Record

Date & Time:	31/10/16 8am
Author:	CE
Plant Operating:	
Weather:	Fine

Site Observations and Instructions:
Courtesy visit of site. Observed that topsoil is being stripped from proposed fill areas for this season and fill materials are being conditioned in the centre of the site to dry them out. Bulk works will be starting this week and Mike is to go out to observe topsoil stripping from first areas tomorrow morning.

Conditioning materials

04/11/16

07 November 2016 11:01

Site Inspection Record

Date & Time:	04/11/16 - 10am
Author:	MVC
Plant Operating:	2x scrapers, 2x bulldozers w/ carts, 2x excavators
Weather:	

Site Observations and Instructions:

Visited above site at request of Trevor (Dines) to inspect topsoil stripping of Cut Areas 10 and 12, observe gully muckout.

Topsoil at Cut Area 10 had been stripped adequately and may be used for Fill Area M and Fill Area F as soon as weather permits.

Cut 12 was approximately 70% complete, but requires finer weather to cart the rest of the unsuitable materials off the area.

There was a stockpile of slightly clayey silt which Trevor wishes to use and mix with Cut Area 12 ash materials so that he can continue to fill Fill Area F. Following a phone conversation with Chris, we considered it would be OK, however Trevor will need to send us a Topo plan of the area he intends to cut from in Cut Area 12. There is also a portion in Fill Area F where topsoil has not been stripped near the gully invert and will need to be remediated prior to filling this area.

Gully muckout at Fill R was undertaken so that their silt pond and clearwater diversion could be constructed. Gully was mucked out to inorganic, alluvial clays however VSS of these materials were approx. 28kPa - 42kPa, indicating firm subsoils. Also, the underfill drainage in this gully has a lower invert level of the stormwater connection that crosses the train tracks, meaning that a bubble up chamber/manhole/cesspit with non-perforated pipes may be required to discharge groundwater into.

As for the firm soils in the gully, we will decide whether to lay SPR down to fill upon or whether to continue undercutting until stiffer subsoils are reached.

Will need to discuss with Chris.

09/11/16

10 November 2016 09:32

Site Inspection Record

Date & Time:	09/11/16 - 3pm
Author:	MVC
Plant Operating:	Several bulldozers with scoops, scrapers, tractors with discs, excavators
Weather:	Fine

Site Observations and Instructions:

Visited site with Chris to discuss with Trevor a method for the underfill drainage at Fill R. Considered running hiway grade perforated novaflos (160mm) in the inverts of gullies and under the pond area, assuming a clay capping of at least 1m would be achievable to not allow groundwater to flow through the pond and into the underfills. The underfills should be tapped to the stormwater culvert which runs beneath the railway, with a seepage collar on the northern side of the pond that embeds 300mm vertically into the clay fill. Underfills need to placed in fully wrapped drainage metal. We will complete CAN#01 for this.

Looked at Fill F, there is an area of dark grey material that should be removed. Also some areas that need tidying up upslope towards the existing road.

Fill F Gully has been mucked out and shear strengths in the base were all over 80kPa, we are satisfied this is undercut down to competent ground. Discussed underfills in the main gully of fill F. Several springs will need to be tapped with novaflos in trenches and run down the invert of the gullies.

Gullies at Fill O and Fill N were being mucked out and looked to be into inorganic materials, however the rain over the last couple of days has caused minor slips. Will test these gullies on Friday.

Fill O Gully

Fill O Gully

Dark patch of Fill F

11/11/16

Friday, 11 November 2016 1:07 PM

Site Inspection Record

Date & Time:	11/11/16 12pm
Author:	Mvc
Plant Operating:	
Weather:	Fine

Site Observations and Instructions:

Visited site at request of Brett (Dines) to inspect subgrade of Fill O gully and Fill f contaminated area undercut.

Upper reaches of fill O gully has been mucked out sufficiently with subgrade testing shear vane dial readings above 80kPa in most areas. Further down the alignment, soft ground was still intact towards the silt decant. This will need to be inspected next week. Since access to this area would be difficult, Brett has considered laying fully wrapped hiway grade perforated underfills in drainage metal along the toe of the cut batter and tapping any springs, and backfilling before accessing the lower reaches of the gully where the soft material is.

The contaminated area undercut was mostly above 80kPa with occasional soft soft spots where some slurry was but over 4m of proposed fill will overly this. Advised Brett to lay fully wrapped underfills in this area too, hardfill i.e. gap65 will need to be used below this in the bottom of the pit to allow the water table to rise up to the underfill to alleviate groundwater pressures.

Will visit site on Monday or Tuesday if weather permits.

4m deep pit at contaminated area undercut

Looking up contaminated area undercut

14/11/16

15 November 2016 16:48

Site Inspection Record

Date & Time:	14/11/16 - 5pm
Author:	MVC
Plant Operating:	Scrapers, Bulldozers w/ Scoops, Excavators, Tractors with discs
Weather:	Fine

Site Observations and Instructions:

Visited site at request of Trevor to inspect underfill drainage in Fill R and Fill F gullies.

Underfills were installed as per our recommendations. However, in Fill R, they could not continue as the waterlevel in the invert of the gully was too high to place the gravel. In Fill F, the contaminated area had not been backfilled with hardfill yet so they couldn't extend the drain coil across the pit.

Fill O gully had been mucked out again and had been benched on the western side, however they are yet to bench it on the eastern side.

21/11/16

Monday, 21 November 2016 2:12 PM

Visited Hitchen block at the request of the contractor to inspect Fill O and N gully muck outs and confirm underfill alignments. Haul road strip, and pond 8 strip.

Satisfied with fill N, all shear strengths were above 90kPA. Recommended that an underfill drain coil is run up the invert fully wrapped in drainage and SPR is placed for a flat base to compact on.

Fill O still needs a small amount of organic clay mucked out near the decant, but aside from that it is satisfactory. Shear strengths were <30kPa and organics are about 600-800mm deep.

Satisfied with haul road strip at cut 16 and cut 14.

Satisfied with topsoil strip at pond 8. Although still need to see under topsoil stockpiles.

Trevor wants another visit Wednesday lunch time.

23/11/16

Wednesday, 23 November 2016 12:37 PM

Site Inspection Record

Date & Time:	23/11/16
Author:	MVC
Plant Operating:	2x scrapers, 2x bullies n scoops, several excavators
Weather:	Fine

Site Observations and Instructions:
Visited site at request of contractor to observe fill O and N gully underfills and pond 8 area.

Gully underfills were placed where requested, and fully wrapped in cloth and drainage metal.

Inspected topsoil stripping at Pond 8 and lower reaches of cut 16. They are cutting from cut 16 for Pond 8 and it is all good ash clay going down well. Natural subgrade shear strengths in fill areas of pond 8 were all over 120kPa.

Fill M has begun being striped now that it has dried up. Should look at this next visit on Tuesday/Wednesday.

Pictures below.

29/11/16

Tuesday, 29 November 2016 11:05 AM

Site Inspection Record

Date & Time:	29/11/16
Author:	MVC
Plant Operating:	Bully and scoop, grader bully, scrapers, compactors etc.
Weather:	Fine

Site Observations and Instructions:

Visited site at request of Trevor (Dines) to inspect topsoil strip inspection at Fill M which was to wet to open up earlier due to perched groundwater.

Topsoil was stripped adequately down to the haul road. Downslope of this is a silt control decant. Exposed materials were very silty clays with shear strengths of approximately 40kPa. Conducted several shallow boreholes and found that 50-100mm below these Materials were much stiffer silty clays. Advised Trevor to strip the surface of these materials and mix them into the more plastic ashy clays from cut 10.

Also looked at the construction of pond 8.
Trevor has needed to use a uPVC 160mm, thick walled non perforated pipe connecting to a 100mm dia manhole instead of the 600mm in the detail so that it is accessible to work inside it. 600mm would be too confined.

Looked at Fill N and O gullies. These have come up well.

Action: Discuss with chris of where to position an underfill at fill M for any winter seepage.

12/12/16

Monday, 12 December 2016 10:55 AM

Site Inspection Record

Date & Time:	12/12/2016 10am
Author:	Mvc
Plant Operating:	
Weather:	Fine

Site Observations and Instructions:

Visited site at request of Trevor to undertake Fill G and H topsoil stripping inspection.

Topsoil was stripped adequately over most areas (about 80%). Some areas needed more scraping and tidying up.
Stripping exposed natural ash deposits comprising inorganic, very stiff silty clays. Vane shear strengths ranged from 135kPa to over 200 kPa, averaging over 150kPa.
Advised Trevor to send pics.

Also observed fill placement across Fill M. Fill materials were mostly red and orange inorganic silty clays. Shear strengths were UTP in most places.

Trevor instructed us to consider whether the bubble up manhole needed to be filled with drainage chip or not.

Site Inspection Record

Date & Time:	10/02/17 10am
Author:	CE
Plant Operating:	
Weather:	Fine

Site Observations and Instructions:
In Mike Chan's absence called to site by Trevor to inspect the upper portion of the Fill I gully muckout. Mike has already inspected and signed off the lower half of Fill I gully muckout.

Noted that the upper portion of fill I gully contains an approx. 25m wide by 100m long area of very soft material (ie. very hard to walk on).

Dug two trial pits through the material, which confirmed that it comprised of saturated pumiceous clayey silt with shears around 10kPa to 15kPa. The depth of the material is unknown as could only dig to between 2 and 2.8m due to pit cave in. Appears that this material will need to be undercut, but will check with Shane to check if any other options (ie. settlement monitoring before instructing Dines. Fill over this area is around 3 to 5m.

Friday, 3 March 2017 12:10 p.m.

Site Inspection Record

Date & Time:	02/03/17
Author:	MVC
Plant Operating:	
Weather:	Fine

Site Observations and Instructions:

Visited site at request of Trevor to inspect rotten rock and underfill drainage placement at gully I, and fill placement at gully I and P. Underfills have been placed as per our recommendations. Trevor has asked the underfill to terminate at where it is now (natural stripped ground, above the gully head), and no seepages are noted at that area. Confirmed with Chris.

The clay fill appears to be going down well across the lower reaches of these gullies, with shear strengths all over 140kPa.

An area on the ridgeline is pumping (likely due to groundwater pressures) and a trial pit investigation is planned for next Monday. Possible that this area should be undercut and tapped with a drain coil and wrapped drainage media, running into the underfill in Fill I, then backfilled with compacted clay.

06/03/17

Monday, 6 March 2017 4:02 p.m.

Site Inspection Record

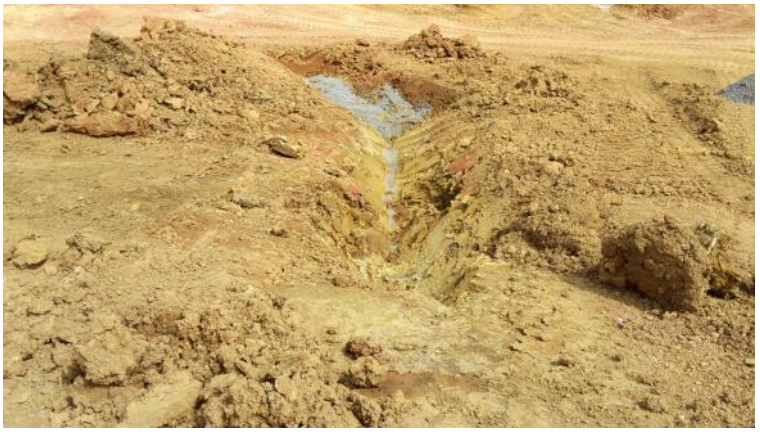
Date & Time:	06/03/17
Author:	MVC
Plant Operating:	
Weather:	

Site Observations and Instructions:

Visited site at request of Trevor to inspect subgrade pumping between Gully I and P, and topsoil strip and muckout at gully P. The subgrade pumping seems to be localised to roughly a 20m x 20m area. A V-drain was trenched up toward the area, and wet sediments were exposed on the sides to approximately 1m depth.

Since the subgrade has been sheared, undercutting will be necessary in this area sometime later in the week or next week (weather dependent) and advise when it is exposed so a method of drainage can be confirmed.

Gully P had been stripped another 30-40m upslope. Strip had gotten rid of most unsuitables. Told operator to continue this through and continue placing at least half a meter of rotten rock in the invert of the gully where it is wet to elevate clay from wetting.



13/03/17

Monday, 13 March 2017 2:03 p.m.

Site Inspection Record

Date & Time:	13/03/17 12pm
Author:	CE
Plant Operating:	
Weather:	Wet

Site Observations and Instructions:
Drive over of site with MVC to check on progress. There are two small gullies left to fill to complete the bulk works for the season (approx. 50,000m3 of fill still to place. Areas are being progressively topsoiled as they are completed in stage 3.

Site is very wet after last week's 1:100 storm events so works won't re-commence until later this week.

20/03/17

Monday, 20 March 2017 2:30 p.m.

Site Inspection Record

Date & Time:	20/03/17 12pm
Author:	CE
Plant Operating:	
Weather:	Fine

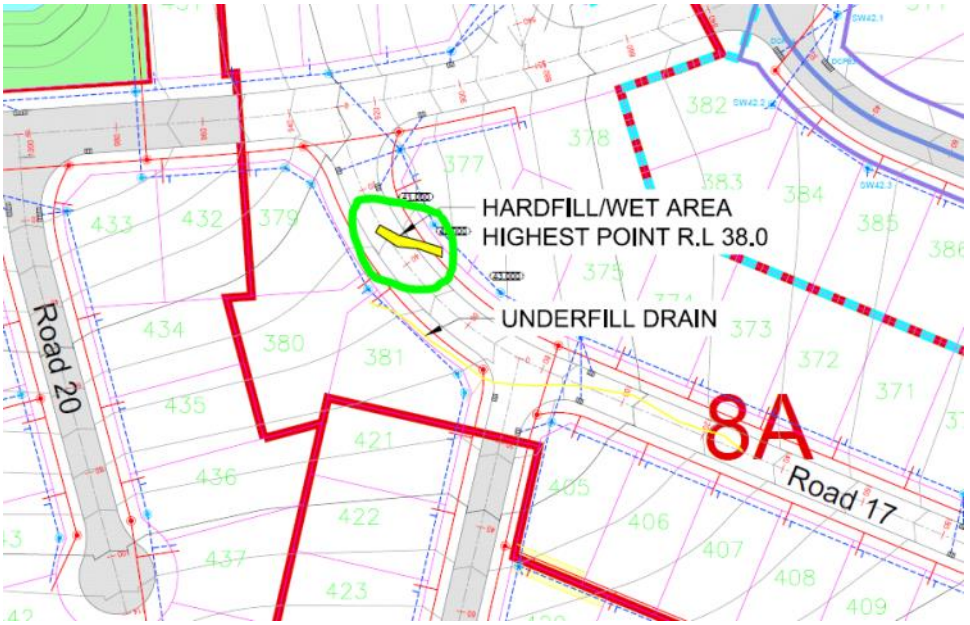
Site Observations and Instructions:
Walkover of site with SGL. Observe the pumping/spring area at the base of gully area (as per plan). This area is beneath the road so they are going to tap the spring into the exisitng underfill drain, undercut the pumping ground and then backfill with compacted clay. Trevor to get in contact once area is undercut for us to inspect.

Also looked at the top of this gully. There is a spring here also which will likely need tapping with a 2m deep chimney drain subject to observations once cut to grade in this area.

Top of gully - needs drain run up as chimney drain once fill cover less than 2m to tap spring and ensure adequate coverage over drain is maintained

Underfill drain being installed

Spring area at base of gully (near subgrade level). This area is under road and just needs to be treated as necessary to build road.



Area of spring (base of gully) circled with green pen.

22/03/17

Wednesday, 22 March 2017 4:43 p.m.

Site Inspection Record

Date & Time:	22/03/17
Author:	CE+MVC
Plant Operating:	
Weather:	Fine

Site Observations and Instructions:

Observed there is a spring still coming through the area at the base of gully to the side of the metal placed yesterday. Spring will need to be tapped with novacoil and run to underfill drain before filling over area with clay.

Site Inspection Record

Date & Time:	
Author:	MVC
Plant Operating:	
Weather:	

Site Observations and Instructions:

Visited site at request of Trevor. Looked at seepages coming from south-eastern corner of Cut 13. Looks to still be seeping on the surface. Discussed drainage. Will get Trevor to send through a surveyed plan of areas affected by the seepage.

Looked at middle tributary gully strip (middle gully) of Fill P. This strip has began at the elevated portions and has not yet connected to the gully junction. Drain coil, cloth and rock all look good and to normal standards.

26/04/17

Monday, 24 April 2017 4:21 p.m.

Site Inspection Record

Date & Time:	
Author:	MVC
Plant Operating:	
Weather:	

Site Observations and Instructions:

Visited site at request of Trevor Moir to check westernmost tributary gully within Fill P. Drain coil extending to the head of the gully with approx. 400mm drainage metal, fully wrapped, and 0.5m SPR blanket should be required up to the head of this gully. More mucking out is required.

Trevor thinks that the seepage at the Cut 13 southern portions is due to perched GW table above a hard pan of silts/clays.

15/05/17

Monday, 15 May 2017 5:48 p.m.

Site Inspection Record

Date & Time:	15/05/17 10am
Author:	CE
Plant Operating:	
Weather:	

Site Observations and Instructions:
Inspected the Slip that has formed near Fill O. Looks like has formed due to overland flow. Shane is going to meet with Russell tomorrow to discuss options. Will get repaired as part of works next season.

Walked over rest of site with Shane. Plant is parked and site is wet. Trevor advised that they may give it one more go before winter to undertake earthworks and then will shut down for winter.

14/09/17

Thursday, 14 September 2017 3:01 p.m.

Site Inspection Record

Date & Time:	14/09/17 1.30pm
Author:	MVC
Plant Operating:	
Weather:	Overcast but dry

Site Observations and Instructions:

Visited site at request of Trevor Moir to inspect topsoil stripping for lots 60-61 where the overland flowpath is. Lot 60 is getting cut down and Lot 61 is getting elevated, with minimal cut and fills up to approx. 0.5m.

Topsoil appeared to be stripped adequately, with minor pockets although very shallow (i.e. less than 50mm in most places) but the operator will run the padfoot over the subgrade prior to filling anyway to mix this in and punch it through.

19/09/17

Wednesday, 20 September 2017 9:21 a.m.

Site Inspection Record

Date & Time:	19/09/17
Author:	MVC
Plant Operating:	
Weather:	Fine

Site Observations and Instructions:

Visited site to inspect fill placement over lots 60-61 where minor cut to fill had occurred late last week.

The lots had already been topsoiled. Drilled 5 boreholes into the topsoil to expose the fill and vane shear strengths were all off the dial (140+) or UTP. Soil appeared well compacted and moist.

26/10/17

Thursday, 26 October 2017 3:35 p.m.

Site Inspection Record

Project # & Name:	J00113 - Hitchen Block
Date & Time:	26/10/17 12pm
Author:	CE+SL
Plant Operating:	2 x scrapper, 6 x digger
Weather:	Showers

Site Observations and Instructions:
Met Trevor on site to check on progress. He advised that they have just recommenced in fill areas P and I. Not much work occurring so far due to wetness of the site.

Fill P

1/11/17

Wednesday, 1 November 2017 1:30 p.m.

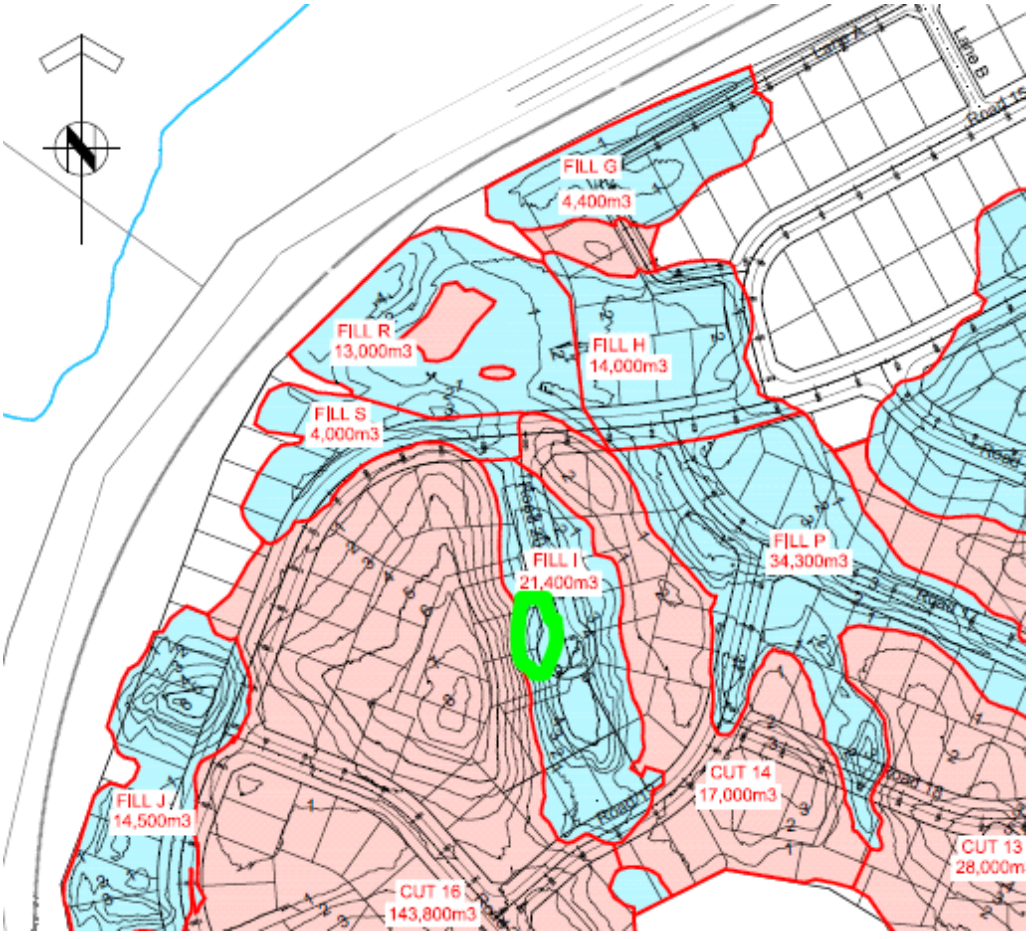
Site Inspection Record

Project # & Name:	J00113 - Hitchen Block
Date & Time:	1/11/17 10:30am
Author:	CE
Plant Operating:	4 x dozer with scraper, 2 x 4wd compactor, 4 x digger
Weather:	Fine

Site Observations and Instructions:

Met with Trevor and inspected the following:

- Observed digout of new section of fill I. Observed they had excavated all mullock and were onto a loose sand. They are going to backfill over this with 1m of SPR100 prior to filling with clay. Fill over this area is 3m to 4m deep.

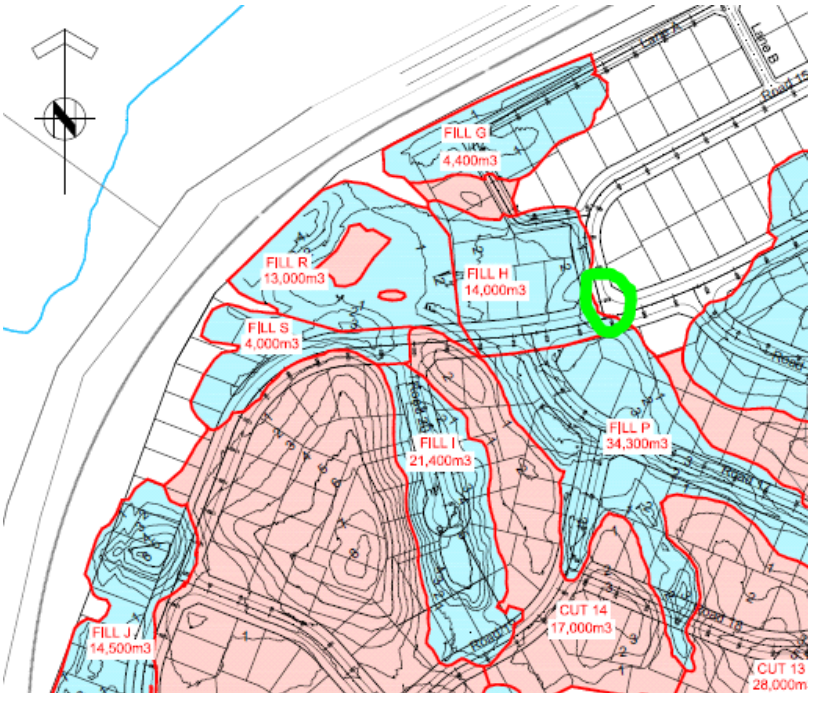


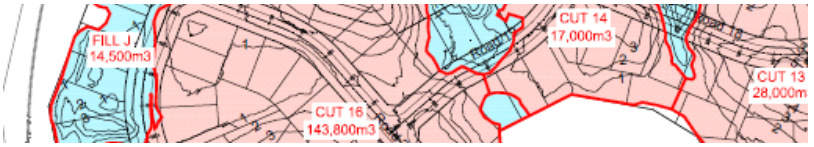
Area mucked out circled green.

Muckout picture

Muckout picture

- Also investigated a soft spot on the edge of Fill H. The soft ground is about 1.5m to 1m deep (shearing 20 on the dial), below the soft ground is stiff clayey silt (shearing above 70 to 100 on the dial). Advised trevor that we will need to chase out this soft area, will send through CAN for this.





Soft area approx. circled TP1 through the soft ground

Area of soft ground

TP2 through the soft ground

TP2 through the soft ground

TP1 through the soft ground

TP1 through the soft ground

TP1 through the soft ground

TP1 through the soft ground

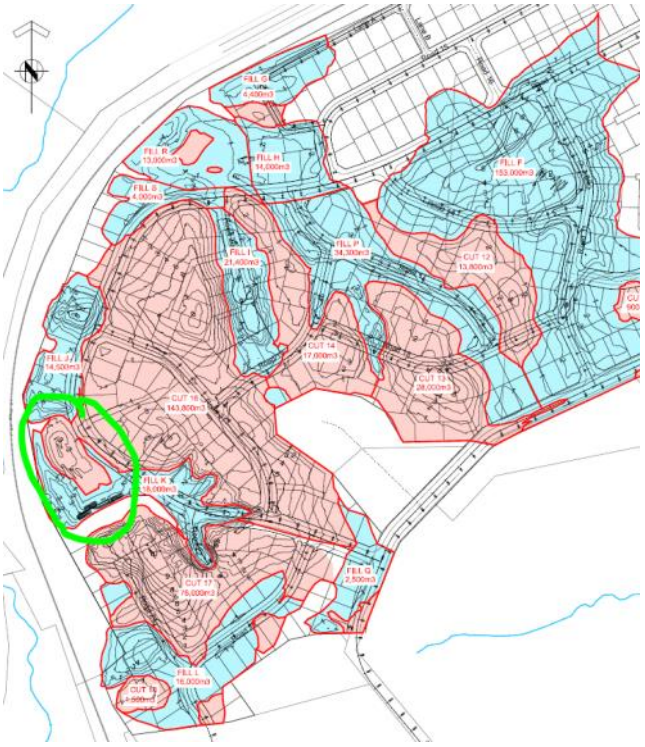
- Also did general walkover of site. They are cutting from Cut area 16 and 14 and filling in Fill P and I currently.
- The pond circled green below will commence shortly.



Pond circled green to commence shortly.

Below are general pictures of site.

10/11/17

Friday, 10 November 2017 2:45 p.m.

Site Inspection Record

Project # & Name:	J00113 - Hitchen Block
Date & Time:	10/11/17 11am
Author:	CE
Plant Operating:	
Weather:	Fine

Site Observations and Instructions:
Observed the progress of the digout of the soft area as circled below. They have chased 70% of area, and will have it completed for inspection early next week.

A layer of SPR will be placed in the base of the area in the deepest portion, however there is nowhere to outlet a drain (it is lower than everywhere else) so a drain won't be installed. Did not note any groundwater seepages.

Other photo's from site as per below:

Fill I - there is an area of seeping groundwater on the right face of the gully - Trevor is going to extend the SPR blanket up this face and tap into the underfill drain in the area.

13/11/17

Monday, 13 November 2017 11:02 a.m.

Site Inspection Record

Project # & Name:	J00113 - Hitchen Block
Date & Time:	13/11/17 9am
Author:	CE
Plant Operating:	
Weather:	Fine

Site Observations and Instructions:
Observed the completion of the undercut. They have cut down to firm ground and the extents of the undercut either have a 2m to 2.5m capping over the softer material or extends under the road. Advised Trevor that we are happy to backfill area, however a base of SPR should be placed to deal with areas of seeping water.

Also inspected up in area where we had recommended a chimney drain due to springing water - the water seepages have stopped since they cut the area around the site shed. They are therefore not going to install the chimney drain and we will keep an eye on the area, noting that underchannels and stormwater lines with likely pick up any seeping water in the area.

They have also installed the SPR rock blanket in Fill I where some water seepage was noted in gully face.

Fill P

Undercut area

Undercut area

Undercut area

Fill I - SPR blanket located near where compactor is.

17/11/17

Friday, 17 November 2017 2:12 p.m.

Site Inspection Record

Project # & Name:	J00113 - Hitchen Block
Date & Time:	17/11/17
Author:	MVC
Plant Operating:	
Weather:	Fine

Site Observations and Instructions:

Visited site to catch up with Trevor about earthworks operations. Undercut was being extended to road boundary upslope. They will not undercut the road yet as the subgrade will be subject to Scala results anyway.

Silt pond at southwest of stage 3 will commence construction next week and Trevor expects an inspection for the gully muckout (that intercepts the pond) around early week after next.

Also looked at SPR blanket on west of Fill I.

28/11/17

04/12/17

Monday, 4 December 2017 4:12 p.m.

Site Inspection Record

Project # & Name:	J00113 - Hitchen Block
Date & Time:	04/12/17
Author:	MVC
Plant Operating:	
Weather:	Fine

Site Observations and Instructions:

Visited site at request of Trevor to inspect Fill K easternmost gully strip. Wasn't completed in all areas but they will continue. Upslope looks relatively dry so SPR may not be required but an underfill still will need to feed up to it.

Also inspected fill J gullies. Topsoil was stripped adequately where it had been stripped. Southern one was completely stripped but northern one was half stripped. Advised Trevor we would send a can through to put underfill drains in
these areas, although they were dry, it is likely that springing will occur during winter months.

Elsewhere, Hitchen Stage 3A pond was being finished but underfill outlets still need to be formed. Some lots were not topsoiled yet.

11/12/17

Monday, 11 December 2017 3:06 p.m.

Site Inspection Record

Project # & Name:	J00113 - Hitchen Block
Date & Time:	11/12/17
Author:	MVC
Plant Operating:	20T digger
Weather:	Fine

Site Observations and Instructions:

Visited site at request of trevor to inspect the muckout operations of the southernmost gully in Fill K. In most places, they had stripped down to something firm to place their SPR mattress upon, however, some organic material was still present and this was advised to be undercut (only by 500mm to something decent).

Advised trevor to use the same methodology on the easternmost gully.

12/12/17

Tuesday, 12 December 2017 3:55 p.m.

Site Inspection Record

Project # & Name:	J00113 - Hitchen Block
Date & Time:	12/12/17
Author:	MVC
Plant Operating:	
Weather:	Fine

Site Observations and Instructions:

Visited site to investigation slip at the southern side of Fill M into the gully. Photos are on server.

Inspected Fill K gully muckout just upslope of proposed pond. Trevor was considering leaving some of the organic materials in, provided we have enough cover of good materials above. It appears to be 2.5m from the top of the mucked out organics to the finished level of the road*. Chris will send a CAN.

*Some of the muckout will be within a lot.

Visited site for final walkover of Stage 4B prior to GCR report drafting.
No stockpiles or bare ground except for the berms where the services will be installed and associated windrows.

11/09/18

Wednesday, 12 September 2018 9:12 a.m.

Site Inspection Record

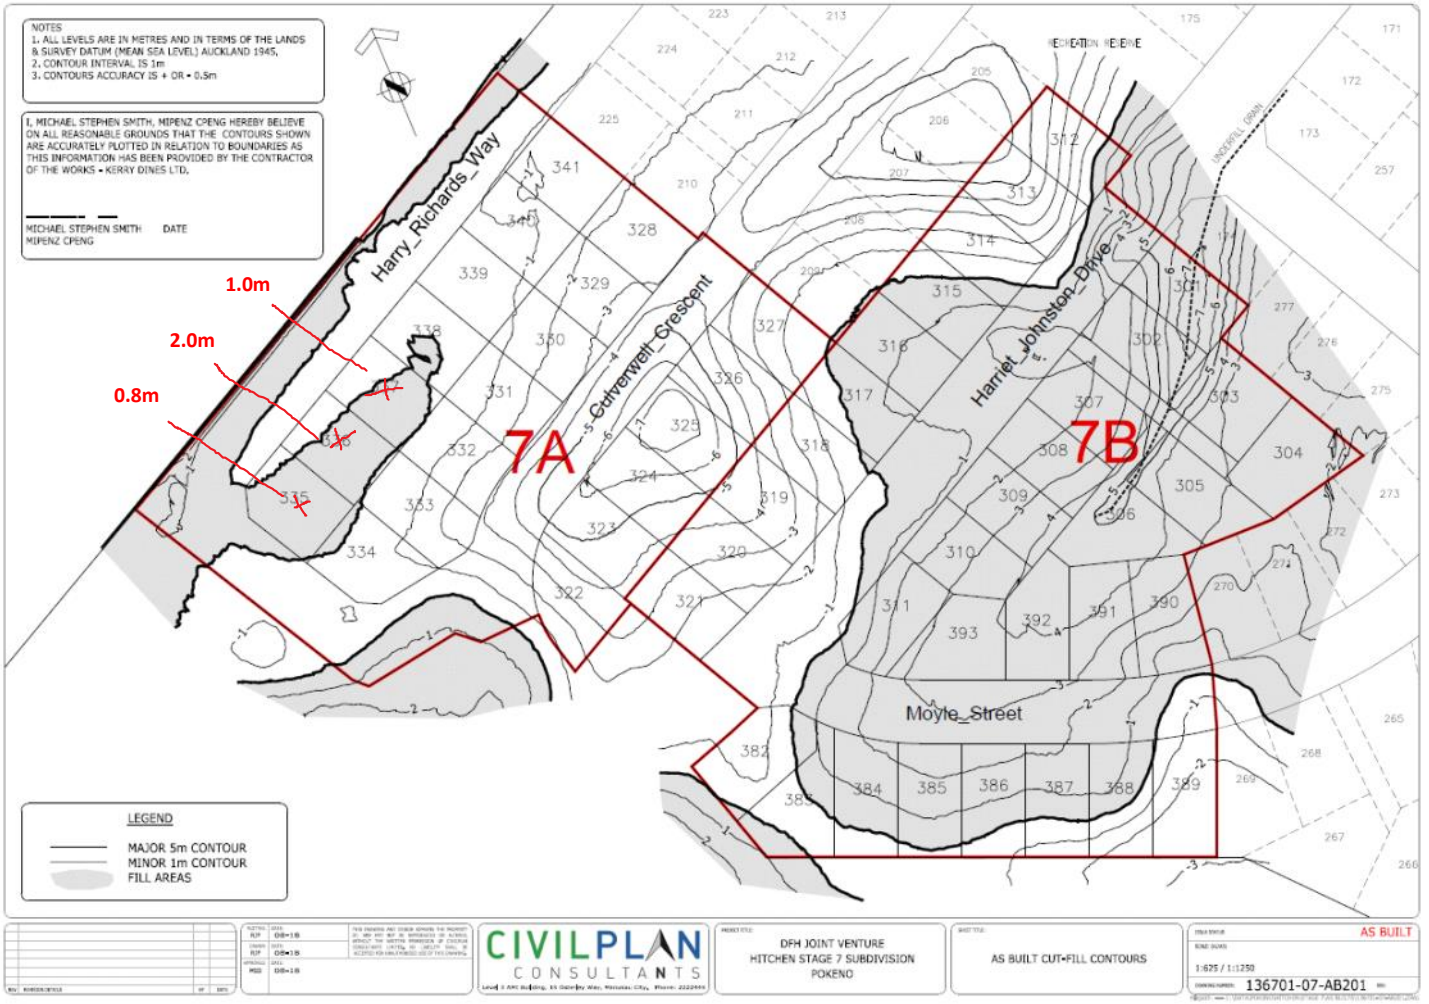
Project # & Name:	J00113 - Hitchen Block
Date & Time:	11/09/18
Author:	MVC
Plant Operating:	
Weather:	fine

Site Observations and Instructions:

Visited site to investigate extent of non-engineered fill area over lots 335-337 where the GCR borehole for lot 336 found firm and wet clay fill at depths of up to 1.8m.

Drilled 2m HA boreholes in lots 335 and 337 and found at least 2m of mostly clay fill (depths of less than 1m fills are shown on as-built plans).
In lot 335, clay fill with firm to stiff vane shear strengths was encountered up to 0.8m where it became consistently very stiff.
In lot 337, a similar material was found up to 1.0m. Moisture contents to these depths appeared wet of optimum.

Drilled a borehole in lot 333 and found cut ground.



18/09/18

Tuesday, 18 September 2018 3:10 p.m.

Site Inspection Record

Project # & Name:	J00113 - Hitchen Block
Date & Time:	18/09/18
Author:	MVC
Plant Operating:	
Weather:	Fine

Site Observations and Instructions:

Visited site at request of Trevor to inspect a groundwater spring at the cut/fill line between Fill K and Cut 17, to the west of Road 22 cul-de-sac. Groundwater effects appeared to be localised to the area and no surface weaving was observed that could indicate excess porewater pressures beneath the fill here.

See CAN09 recommendations for this groundwater spring.

Site Inspection Record

Project # & Name:	J00113 - Hitchen Block
Date & Time:	20/09/18
Author:	MVC
Plant Operating:	
Weather:	fine

Site Observations and Instructions:

Visited site to carry out trial pits with Trevor over lots 335-337 where the GCR borehole for lot 336 found firm and wet clay fill at depths of up to 1.8m.

Lot 337 found natural ground at 1.4m. Groundwater was seeping out at 1m depth, less than 140kPa shear strengths around that depth.
Likely due to the upper layer of fill being placed while wet. Fill underneath was hard.

Lot 336 found natural ground at 2.0m. Groundwater seepages were noted between the fill and natural interface, less than 140kPa shear strengths from approx. 1.5 - 2.0m depth bgl.

Lot 335 found natural ground at 2.1m. Top half metre of fill appeared wet of optimum and was failing in shear strength. Fill beneath this up to 2.1m appeared very stiff to hard.

Natural ground was consistently yellow/brown silt that was impenetrable with shear vane tests.

Advised contractor to remove fill down to natural ground in lots 337 and 336 and get in touch with us to inspect.
Difficult to determine whether all the fill needs to be removed in lot 335 as only the top 0.5m was below 140kPa (non-engineered). Will be subject to inspections once undercutting commences.

Weather:	

Site Observations and Instructions:

Visited site at request of Trevor and Stephen to inspect Lots 336 and 337 undercut down to natural ground as requested in CAN08.

Lot 335 had not been undercut yet. Advised Trevor to undercut towards the trial pit in Lot 335. Only the top 0.5m required undercutting apparent from the trial pit, and the contractor was also advised to chase the seam of wet fill til it runs out. Trevor will take photographs and Lander to confirm the undercut is to its satisfaction.
